
Activities

Engineering

The systems are engineered using the very latest software. All modules are equipped with a control panel. In the event of a fault it will automatically appear on the screen or be discovered by fault analysis through LED signalling.

Production

In addition to supplying a standard module, N2Safety can supply custom-built modules according to client specifications. Skids, however, are all built in accordance with the rules of a classification society. N2Safety works with the following classification societies:

- American Bureau of Shipping;
- Bureau Veritas;
- Lloyd's Register of Shipping;
- Det Norske Veritas;
- Germanischer Lloyd;
- Registro Italiano Navale;
- Nippon kaiji Kyokai.

Service

The service provided by N2Safety extends across the globe. The skids themselves are easy to maintain and are built in such a way that components can easily be replaced, if necessary. This results in short service times.

Commissioning

Before delivering the module it is tested and pre-commissioned on the production location ensuring the quickest possible implementation on site.
